What is Android?

- mobile operating system maintained by Google
 - originally purchased from Android, Inc. in 2005
- runs on phones, tablets, watches, TVs, ...
- based on Java (dev language) and Linux (kernel)

- the #1 mobile OS worldwide
 - and now #1 overall OS worldwide!
- has over 1 million apps published in Play Store
- code is released as open source (periodically)
 - easier to customize, license, pirate, etc. than iOS

Why develop for Android?

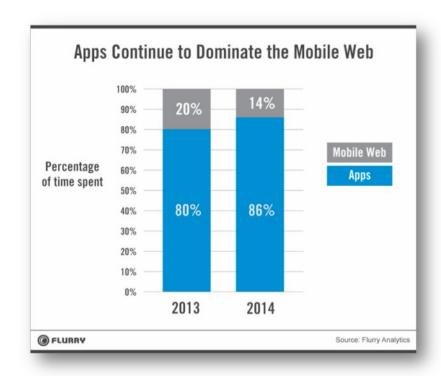

- Why not just write a web site? Android has a browser...
 - better, snappier UI with a more consistent user experience
 - able to use different kinds of widgets/controls than in a web page
 - more direct access to the device's hardware (camera, GPS, etc.)
 - users highly prefer apps over mobile web browsing

Mobile Web App

Native App on iOS

Why not iOS?

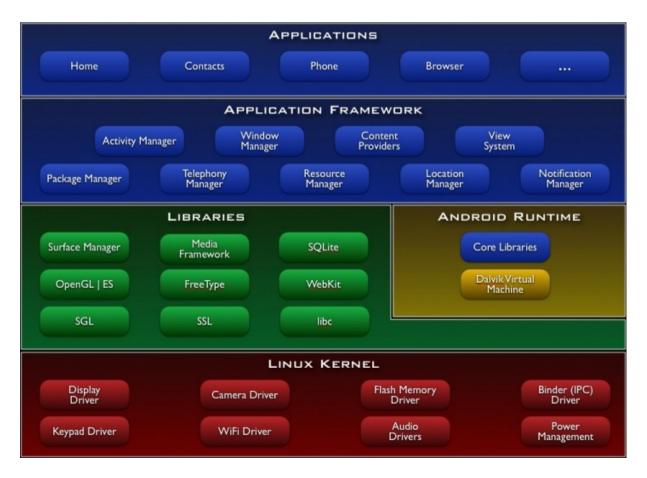

- Why not write apps for iOS, which runs on iPhones and iPads?
 - familiar programming language (Java instead of Obj-C or Swift)
 - free developer tools(Apple charges \$\$\$ for theirs)

- more liberated app store (can make an app and put on your phone or others')
- Android has a larger install base
- there is already a CS 193P class for building iOS apps! Take it!

Android architecture

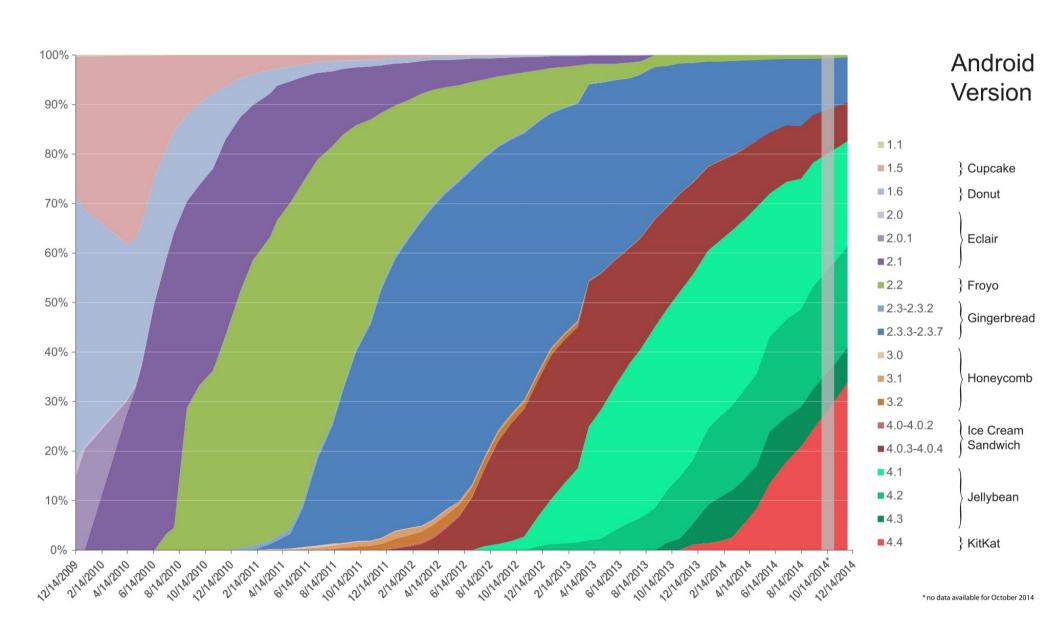

- Android OS provides libraries for many system features like contacts, phone dialing, notifications, 2D/3D graphics, database access, security / encryption, camera, audio, input/output, ...
 - Android Java code is compiled into a special Dalvik binary format

Android version history (link)

Version	API level	Date	Name
1.0-1.1	1,2	Sep 2008	none
1.5	3	Apr 2009	Cupcake
1.6	4	Sep 2009	Donut
2.0-2.1	5,6,7	Oct 2009	Eclair
2.2	8	May 2010	Froyo
2.3	9,10	Dec 2010	Gingerbread
3.0	11,12,13	Feb 2011	Honeycomb
4.0	14,15	Oct 2011	Ice Cream Sandwich
4.1-4.3	16,17,18	Jun 2012	Jelly Bean
4.4	19,20	Sep 2013	Kit Kat
5.0	21	Jun 2014	Lollipop

Android version distribution

Version issues

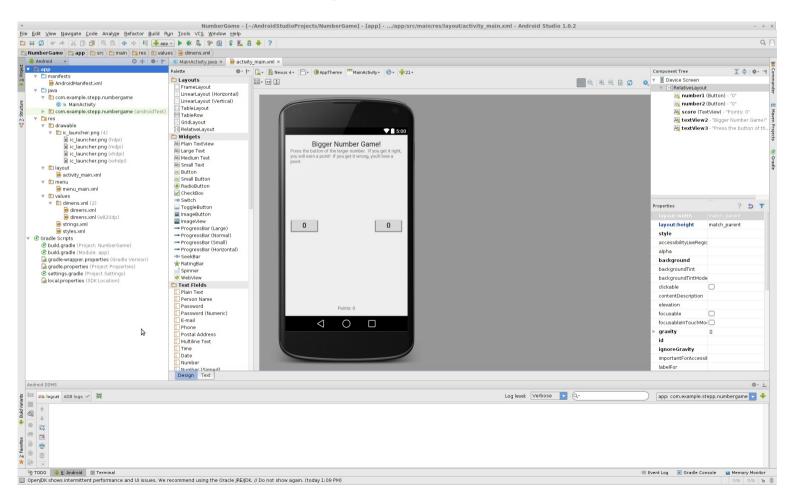

- Check your phone's version of Android:
 - Settings → System → About Device → Android version
 - "Why wouldn't my phone have the newest Android version?
 Can't I just update it?"
- Several companies affect whether your device is up-to-date:
 - Google; phone manufacturer; service provider; ...

• If any company in the chain doesn't want to push out an update for your device, it can become out of date.

Android Studio

- Google's official Android IDE, in v1.0 as of November 2014
 - replaces previous Eclipse-based environment
 - based on IntelliJ IDEA editor; free to download and use

Project structure

AndroidManifest.xml

- overall project config and settings
- src/java/...
 - source code for your Java classes
- res/... = resource files (many are XML)
 - drawable/ = images
 - layout/ = descriptions of GUI layout
 - menu/ = overall app menu options
 - values/ = constant values and arrays
 - strings = localization data
 - styles = general appearance styling

Gradle

- a build/compile management system
- build.gradle = main build config file

```
арр
  manifests
        AndroidManifest.xml
  iava
     com.example.stepp.numbergame
          MainActivity

    com.example.stepp.numbergame (androidTest)

  drawable
       ▼ ic launcher.png (4)
             ic launcher.png (hdpi)
             ic launcher.png (mdpi)
             ic launcher.png (xhdpi)
             ic launcher.png (xxhdpi)

▼ Iayout

          activity main.xml
          🔯 menu main.xml
     values
       dimens.xml (2)
             dimens.xml
             dimens.xml (w820dp)
          strings.xml
          styles.xml
Gradle Scripts
     📀 build.gradle (Project: NumberGame)
     build.gradle (Module: app)
     gradle-wrapper.properties (Gradle Version)
     gradle.properties (Project Properties)
     © settings.gradle (Project Settings)
     local.properties (SDK Location)
```

Virtual Devices (AVDs)

- allows you to run your project in an emulator
 - a software simulation of an entire Android tablet, phone, watch
 - when you click the "Run" button in Android Studio,
 it builds your app, installs it on the virtual device, and loads it
- must set up virtual device first in Android Studio
- alternative: install your app on your actual Android device!
 - pro: app will run faster,
 better test of real execution
 - con: requires Android device, must be plugged into dev PC

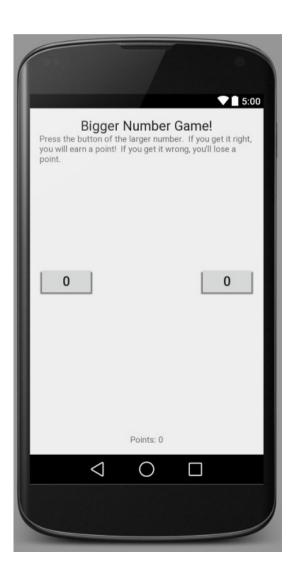

App build process

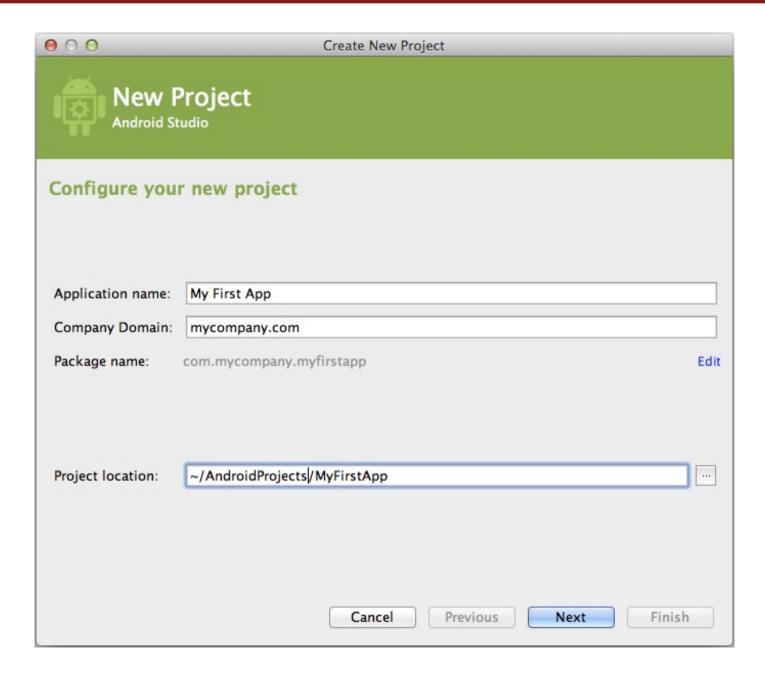

Top-down design

- Let's start from a design of an app that we want to create and then learn the necessary skills to build that app.
- "Bigger Number" game (really dumb)
 - user is shown two numbers
 - must choose which one is bigger by clicking on the appropriate button
 - game pops up brief "correct" / "incorrect" message after each guess
 - get points for each correct answer
 (lose points for incorrect answers)

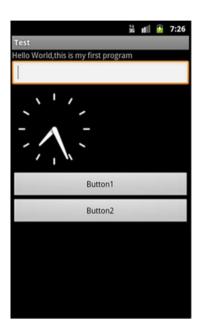

Creating a new project

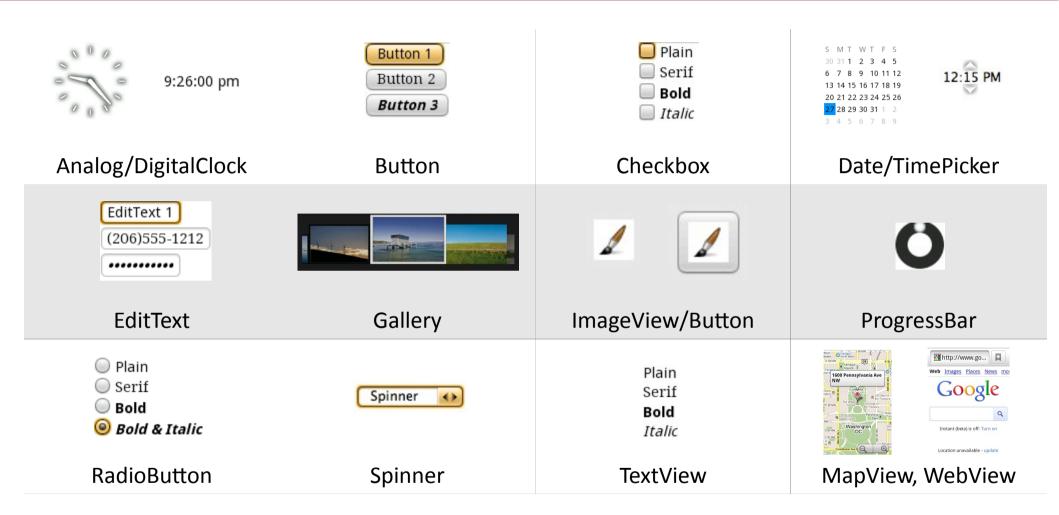

Android terminology

- activity: a single screen of UI that appears in your app
 - the fundamental units of GUI in an Android app
- view: items that appear onscreen in an activity
 - widget: GUI control such as a button or text field
 - layout: invisible container that manages positions/sizes of widgets

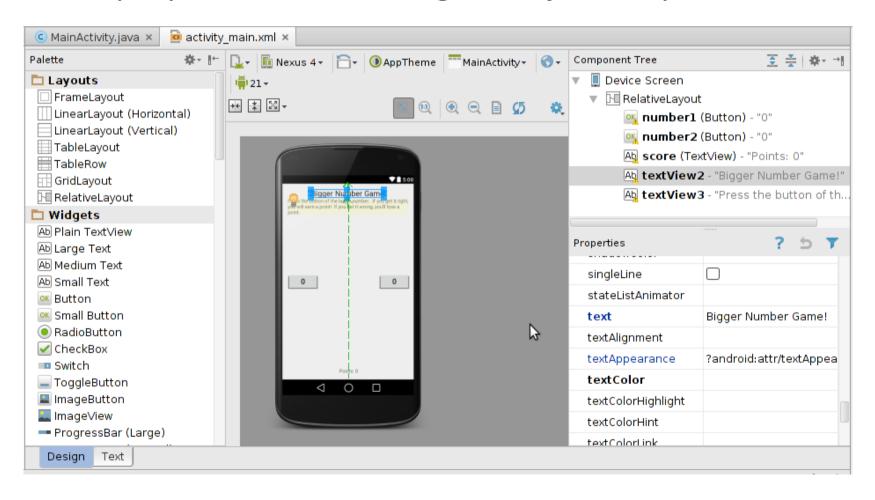

- event: action that occurs when user interacts with widgets
 - e.g. clicks, typing, scrolling
- action bar: a menu of common actions at top of app
- notification area: topmost system menu and icons

Android widgets

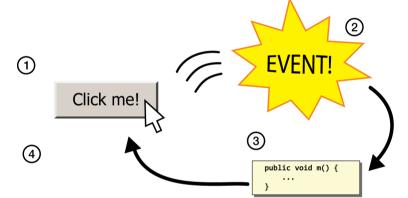

Designing a user interface

- open XML file for your layout (e.g. activity_main.xml)
- drag widgets from left Palette to the preview image
- set their properties in lower-right Properties panel

Events

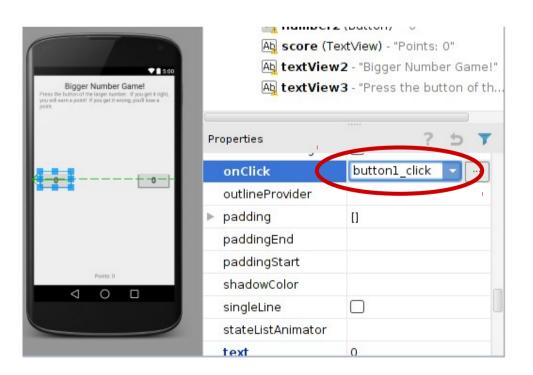

- event: An external stimulus your program can respond to.
- Common kinds of events include:
 - Mouse motion / tapping, Keys pressed,
 - Timers expiring, Network data available

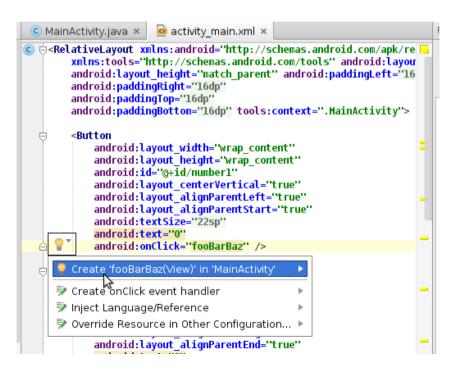

- event-driven programming: Overall execution of your program is largely dictated by user events.
 - Commonly used in graphical programs.
- To respond to events in a program, you must:
 - Write methods to handle each kind of event ("listener" methods).
 - Attach those methods to particular GUI widgets.

Setting an event listener

- select the widget in the **Design** view
- scroll down its Properties until you find onClick
- type the name of a method you'll write to handle the click
- switch to the **Text view** and find the XML for that button
- click the "Light Bulb" and choose to "Create" the method

Event listener Java code

```
库 MainActivity.java 🗴 🔯 activity_main.xml 🗴
      package com.example.stepp.numbergame;
     ∄import ...
 8
      public class MainActivity extends ActionBarActivity {
10
          @Override
11 of
          protected void onCreate(Bundle savedInstanceState) {
               setContentView(R.layout.activity_main);
12
               super.onCreate(savedInstanceState);
13
14
15
16
          public void button1 click(View view) {
17
               // your code goes here
18
19
```

View objects

- each widget has an associated Java object you can access
- they are subclasses of parent class View
 - examples: Button, TextView, EditText, ...
- View objects have many get and set methods that correspond to the properties in the Design view:
 - background, bottom, ID, left, margin, padding, right, text, textAlignment, textSize, top, typeface, visibility, x, y, z, ...
 - example: for a Button's text property, there will be methods: public String getText() public void setText(String text)
 - Find list of properties in Design view, or typing ".get" on a button in Java code, or at: https://developer.android.com/reference/

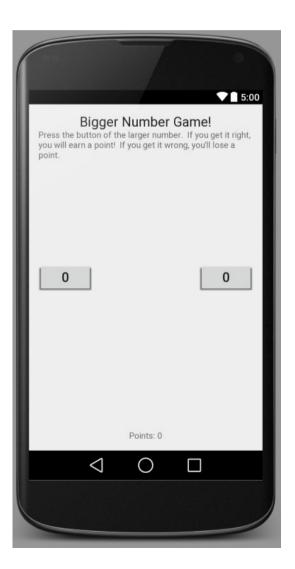

Interacting with widgets

- accessing a widget in the Java code:
 - 1. in Design view, give that view a unique ID property value
 - 2. in Java code, call findViewById to access its View object
 - pass it a parameter of R.id.your_unique_ID
 - cast the returned value to the appropriate type (Button, TextView, etc.)

```
public void button1_onclick(View view) {
    TextView tv = (TextView) findViewById(R.id.mytextview);
    tv.setText("You clicked it!");
}
```

Exercise: Number game

- New let's build that "Bigger Number" game! Recall:
 - user is shown two numbers
 - must choose which one is bigger by clicking on the appropriate button
 - game pops up brief "correct" / "incorrect" message after each guess
 - get points for each correct answer (lose points for incorrect answers)

Displaying Toasts

- where duration is Toast.LENGTH_SHORT or LENGTH_LONG
- A "Toast" is a pop-up message that appears for a short time.
- Useful for displaying short updates in response to events.
- Should not be relied upon extensively for important info.

This is the Toast message
